- Define the term “food chain.”
- What roles do producers, consumers, and decomposers play?
- Give an example of a habitat and the species that live there.
- Explain how energy flows through an ecosystem.

Sample Answers

Each question has specific answers that demonstrate an understanding of ecosystems:

- **What is an ecosystem?** – An ecosystem is a community of living organisms interacting with one another and their physical environment.
- **Define the term “food chain.”** – A food chain is a sequence that shows how energy and nutrients flow from one organism to another within an ecosystem.
- **Roles of producers, consumers, and decomposers:** Producers make their own food through photosynthesis; consumers eat other organisms; decomposers break down dead material to recycle nutrients.
- **Example of habitat and species:** A forest habitat may include trees, birds, squirrels, and insects living together.
- **Energy flow:** Energy flows from the sun to producers, then to consumers, and finally to decomposers, which return nutrients to the environment.
