## Key Gas Laws Covered in Worksheet 2

Gas laws worksheet 2 comprehensively covers the principal gas laws that describe how gases respond to changes in pressure, volume, temperature, and quantity. Understanding these laws is fundamental to mastering gas behavior in various scientific and engineering contexts. The worksheet typically focuses on the following key laws:

### Boyle's Law

Boyle's Law states that the pressure of a given mass of gas is inversely proportional to its volume at constant temperature. Mathematically, it is expressed as  $P_1V_1 = P_2V_2$ . This law is essential for problems involving compression and expansion of gases where temperature remains constant.

### Charles's Law

Charles's Law describes the direct proportionality between the volume of a gas and its absolute temperature when pressure is held constant. The relationship is  $V_1/T_1 = V_2/T_2$ . This law is important when analyzing

temperature effects on gas volume.

## Gay-Lussac's Law

Gay-Lussac's Law relates the pressure of a gas to its absolute temperature at constant volume. It is given by  $P_1/T_1 = P_2/T_2$  and explains how pressure changes with temperature when the volume does not vary.

## Combined Gas Law

The combined gas law integrates Boyle's, Charles's, and Gay-Lussac's laws into a single formula:  $(P_1V_1)/T_1 = (P_2V_2)/T_2$ . This law is used when pressure, volume, and temperature all change simultaneously, providing a versatile tool for solving complex gas problems.

## Ideal Gas Law

The Ideal Gas Law,  $PV = nRT$ , incorporates the amount of gas ( $n$ ) and the gas constant ( $R$ ), extending the gas law concepts to include moles and facilitating calculations involving chemical reactions and molar quantities.

## Sample Problems and Solutions in Gas Laws Worksheet 2

Sample problems in gas laws worksheet 2 illustrate the application of gas laws formulas to typical scenarios, reinforcing theoretical concepts with practical examples. These problems range from straightforward numerical calculations to multi-step processes involving combined gas laws.

### Example Problem 1: Boyle's Law

*Problem:* A gas occupies 4.0 liters at a pressure of 2.0 atm. What volume will the gas occupy if the pressure is increased to 5.0 atm at constant temperature?

*Solution:* Using Boyle's Law,  $P_1V_1 = P_2V_2$ , solve for  $V_2$ :

1.  $V_2 = (P_1V_1) / P_2$
2.  $V_2 = (2.0 \text{ atm} \times 4.0 \text{ L}) / 5.0 \text{ atm}$
3.  $V_2 = 8.0 / 5.0 = 1.6 \text{ liters}$

### Example Problem 2: Combined Gas Law

*Problem:* A gas has a volume of 3.0 L at a pressure of 1.2 atm and a temperature of 300 K. What will be its volume at 2.0 atm and 350 K?

*Solution:* Apply the combined gas law:  $(P_1V_1)/T_1 = (P_2V_2)/T_2$ . Solve for  $V_2$ :

1.  $V_2 = (P_1V_1T_2) / (P_2T_1)$

$$2. V_2 = (1.2 \text{ atm} \times 3.0 \text{ L} \times 350 \text{ K}) / (2.0 \text{ atm} \times 300 \text{ K})$$

$$3. V_2 = (1260) / (600) = 2.1 \text{ liters}$$

### Example Problem 3: Ideal Gas Law

*Problem:* Calculate the pressure exerted by 0.5 moles of an ideal gas in a 10-liter container at 298 K. ( $R = 0.0821 \text{ L}\cdot\text{atm}/\text{mol}\cdot\text{K}$ )

*Solution:* Use  $PV = nRT$  and solve for P:

$$1. P = (nRT) / V$$

$$2. P = (0.5 \text{ mol} \times 0.0821 \text{ L}\cdot\text{atm}/\text{mol}\cdot\text{K} \times 298 \text{ K}) / 10 \text{ L}$$

$$3. P = (12.23) / 10 = 1.22 \text{ atm}$$
