Technical Structure and Syntax

Understanding the technical composition of magi script is essential for effective implementation and optimization.

Basic Syntax Elements

Magi script syntax includes variables, control structures, functions, and operators modeled to provide clarity and functionality. Variables can be declared dynamically, and control flow is managed through standard conditional and looping constructs.

Data Types and Structures

The language supports several primitive data types such as integers, floats, strings, and booleans, along with composite structures like arrays and dictionaries to enable complex data manipulation.

Function Definition and Usage

Functions in magi script are first-class citizens, allowing developers to define reusable blocks of code with parameters and return values, facilitating modular programming.

Error Handling

Magi script includes exception handling mechanisms that enable scripts to gracefully manage runtime errors, enhancing the robustness of applications.

Example Code Snippet

- Variable declaration: $x = 10$;
- Function definition:

```
function greet(name) {  
  print("Hello, " + name + "!");  
}
```
- Conditional statement:

```
if (x > 5) {  
  greet("Developer");  
}
```

Best Practices for Using Magi Script

Adhering to best practices ensures the development of maintainable, efficient, and secure magi script codebases.

Code Readability
