Key Concepts and Definitions

Understanding the foundational terminology and concepts is crucial for mastering exponential functions. The unit 4 exponential functions answer key typically revisits these key ideas to reinforce learning and ensure clarity when solving problems.

Definition of Exponential Functions

An exponential function is a mathematical expression of the form $f(x) = a \cdot b^x$, where a is a nonzero constant, b is the base and a positive real number not equal to 1, and x is the exponent variable. This form is critical in identifying and working with exponential functions in various problems.

Growth and Decay

Exponential growth occurs when the base b is greater than 1, causing the function values to increase rapidly as x increases. Conversely, exponential decay happens when the base is between 0 and 1, resulting in a decreasing function. The answer key clarifies how to distinguish between these two behaviors and how to apply them in solving problems.

Properties of Exponents

The answer key often reviews essential rules such as:

- **Product Rule:** $b^m \times b^n = b^{(m+n)}$
- **Quotient Rule:** $b^m \div b^n = b^{(m-n)}$
- **Power Rule:** $(b^m)^n = b^{(m \times n)}$
- **Zero Exponent:** $b^0 = 1$

- **Negative Exponent:** $b^{-n} = 1/b^n$
